Profile

3rd-year Computer Engineering student at the University of Modena and Reggio Emilia, graduating in 2027 and seeking a for-credit software engineering internship. Delivered 15 custom software projects to 2 freelance clients since February 2026. Shipped 2 iOS apps to the App Store and won 2 of 4 hackathons, placing 2nd in the other 2.

Education

Bachelor's in Computer Engineering 2024 – Present
University of Modena and Reggio Emilia · Mantua
- Passed every 1st- and 2nd-year exam on schedule; now in 3rd year, graduating in 2027.
- Earned a 27.641/30 weighted average.
- Now taking Cyber Physical Security, Intelligent IoT and Machine Learning.

Technical high school diploma in Computer Science 2019 – 2024
ITIS Enrico Fermi · Mantua · Grade 94/100
- Studied programming, databases, systems and networks, and IT security in the Computer Science track.

Experience

Software Developer Feb 2026 – Present
Freelance · Mantua
- Delivered 15 paid projects to 2 clients, a salary-backed loan broker and an association in Mantua: Python scripts, desktop apps and no-code flows in Make and Notion.
- Built a Python macOS app that fills the broker's loan forms from client records in Notion, which are created automatically from incoming Gmail messages.
- Wrote a Python daemon that files, renames and classifies loan documents with local OCR on the broker's Mac, keeping sensitive data off the cloud.
- Automated MantovaSoon's event listings: every morning a scraper reads the previous day's Instagram posts with Gemini, drops duplicates and creates drafts in the CMS.
- Shipped a Python desktop app that fills the association's 4 recurring documents (about 200 contractor forms a year) and emails them.

IT Support Intern Jun 2023 – Jul 2023
Adami Aldo Srl · Porto Mantovano
- Troubleshot hardware and software issues as part of client IT support.
- Maintained and repaired professional printers and cash registers for the company's clients.
- Installed and configured point-of-sale systems for local businesses.

Hackathons

ACQUAM 2026 · Hack4Water Alert 1st place · Mantua Sep 2026
- Tackled a challenge from the Consorzio di bonifica Garda Chiese, a land reclamation authority that received reports of broken pipes and flooded fields by phone or email, with no location or photo.
- Built a no-login web app with a team of 3 for reporting faults with GPS, photos and a voice message that an LLM turns into structured data.
- Designed an operator portal that maps incoming reports, ranks them by danger and assigns them to field staff.
- Added PostGIS geofencing that rejects reports outside the authority's canal network before they are sent.
- Delivered the 8-minute pitch while a teammate demoed the prototype.

ItaliansCodeItBetter 1st place · Milan May 2026
- Created PreventivAI from scratch in 48 hours with a team of 2, a web app that turns a client request into modular quotes for software houses.
- Designed an AI step that extracts requirements, constraints and risks from text or audio, and asks follow-up questions when information is missing.
- Kept pricing deterministic: hours come from past jobs and costs from a fixed rate card, so the AI never invents prices.

SCIoTeM 2026 2nd place · Mantua Feb 2026
- Developed Smart Beam for SIS-TER with a team of 3, a predictive maintenance platform for public street lighting.

- Trained models that estimate each street light's 60-day failure probability and remaining lifetime with survival analysis.
- Explained every risk score in plain words and plotted at-risk lights on a GIS map with maintenance tickets.

SCIoTeM 2025 2nd place · Mantua Feb 2025

- Prototyped P7M AI Summarizer for AATO Mantova with a team of 3, a web app for digitally signed .p7m documents.
- Extracted the original PDF, DOCX or image from the PKCS#7 signature envelope.
- Generated keyword-driven summaries with page references using an LLM.

Projects

Overload Personal iOS app Jul 2026 – Present

- Built an iOS app that logs weight, reps and sets for every workout and charts each exercise's progress over time.
- Designed a minimal interface for fast set logging, as an alternative to subscription-only gym apps with crowded screens.
- Integrated runs, steps and smartwatch data from Apple Health, plus a local-only mode that needs no account.
- Shipped it to the App Store, then added a library of ready-made exercises in v2.

GNAM! First startup Feb 2026 – Jun 2026

- Launched a kitchen app on the App Store that suggests AI recipes from what's at home and tracks inventory and expiry dates for the whole family.
- Validated the idea in public before building the product: in 48 hours the landing page drew 188 unique visitors and 11 waitlist signups.
- Answered the one objection from Reddit and LinkedIn, that nobody wants to update inventory by hand, with GNAM Check, a weekly swipe through ingredient cards.
- Shut it down when the upkeep still cost users more than the value they got back.

Dashboard Personale Personal web app Aug 2026 – Present

- Built a single-user dashboard to replace Notion and two Google Sheets, now covering workouts, finances and freelance work.
- Documented the build in public on LinkedIn, sharing each new piece as it shipped even though the tool is personal.
- Designed daily Recovery, Sleep and Strain scores computed from raw wristband data and Overload workouts.
- Added a muscle heatmap that shows recovery per muscle group and suggests what to train today.
